# Interstate – 94 Exit 161 Operational Analysis Bismarck, ND

---

Final Report

November 2009

Prepared for:  
North Dakota Department of Transportation

Prepared by:  
Advanced Traffic Analysis Center  
Upper Great Plains Transportation Institute  
North Dakota State University  
Fargo, North Dakota

## ***ENGINEERING CERTIFICATION***

This document was  
originally issued and  
sealed by Shawn C.  
Birst, Registration  
Number PE-5438, on  
11/19/2009 and the  
original document is  
stored at the Advanced  
Traffic Analysis Center

I hereby certify that this report was prepared by me or under my direct supervision and that I am a duly registered professional engineer under the laws of the State of North Dakota.

## 1.0 BACKGROUND/OVERVIEW

Over the past several years, Bismarck, ND, has seen a significant amount of development primarily in the north and east portions of the city. As a result of the growth, several roadways have experienced an increase in vehicular traffic. One such roadway, Centennial Road/Bismarck Expressway, has experienced a growth in traffic volume due to several residential developments to the north of Interstate 94 (I-94), and industrial/commercial developments to the south of I-94. In addition, Centennial Road acts as a bypass for traffic traveling to/from the northern part of the city. The increased traffic volume has created operational issues in the vicinity of the Centennial Road/Bismarck Expressway and I-94 Interchange (Exit 161). Moreover, the increased traffic volume along the corridor has made the approaches of Trenton Drive experience significant delays during periods of peak traffic. The North Dakota Department of Transportation (NDDOT) contracted the Advanced Traffic Analysis Center (ATAC) to evaluate various traffic control and geometric alternatives to reduce congestion along the corridor for both the near-term and long-term planning horizons. This analysis will focus on five intersections along Centennial Road/Bismarck Expressway between Century Avenue and Divide Avenue (Figure 1).

Figure 1. Study area with existing intersection control

## **2.0 OBJECTIVES**

This study will evaluate the operational performance near the vicinity of the Centennial Rd/Bismarck Expy and I-94 Interchange. Various traffic control and geometric design alternatives will be evaluated using the existing conditions, as well as several planning horizons. The analyses will provide guidance on selecting the most appropriate geometric configuration and traffic control for the short- and long-term planning horizons. The recommendations of this study will primarily focus on the Centennial Rd/Bismarck Expy and the I-94 Interchange.

## **3.0 ANALYSIS OVERVIEW**

This study consists of both transportation planning and traffic operations activities. To get a better understanding of the corridor's future traffic volume, the Bismarck-Mandan Metropolitan Planning Organization's (MPO) regional travel demand model (TDM) will be used, which is an existing Citilab's Cube model. The operational analyses will be conducted using Trafficware's Synchro software program, which is a software program used for analyzing/optimizing traffic signal timing and performing capacity analyses.

This study will analyze the peak-hour conditions of 2009 (base year), as well as several future planning horizons, which include 2024 (15-year forecast), 2035 (26-year forecast), and 2059 (50-year forecast). The study's steering committee, which consists of representatives from the NDDOT, City of Bismarck, and the Bismarck-Mandan MPO, will be used to determine the appropriate roadway network and future level of development east of Exit 161. While the operational activities will focus on the five intersections shown in Figure 1, the planning-level study area encompasses a much larger area, which includes the Centennial Rd/Bismarck Expy corridor from 48<sup>th</sup> Ave. S. to 71<sup>st</sup> Ave. N. (7 miles) and east to 80<sup>th</sup> St. E. (3 miles). The larger planning area is used to account for additional development that will influence the traffic volume along Centennial Rd/Bismarck Expy, as well as adjacent roadways.

The TDM's average daily traffic (ADT) estimates and trends will be incorporated into the Synchro model, which will also include various combinations of traffic control and geometric modifications. These analyses will provide several measures of effectiveness (MOE), including network delay, intersection level of service (LOS), and queue length.

## **4.0 ANALYSIS SCENARIOS**

In terms of the TDM's network geometry, the 2024 scenario will include the existing geometry and proposed improvements that are planned and programmed according to the Bismarck-Mandan MPO's Transportation Improvement Plan (TIP). The 2035 and 2059 scenarios are based on some of the alternatives being evaluated as part Bismarck-Mandan MPO's 2035 Long-Range Transportation Plan. The long-term networks include the existing and committed transportation projects, as well as an interchange at 66<sup>th</sup> St. E. (2 miles east of Centennial Rd/Bismarck Expy), which will be connected to the north with 71<sup>st</sup> Ave. N. and to the south with Main Ave. and 48<sup>th</sup> Ave. S. The 66<sup>th</sup> St. E. Interchange will serve as a bypass that may improve the traffic operations of the Centennial Rd/Bismarck Expy. The scenarios that will be evaluated in this study are as follows:

### **Base Year (2009)**

- Existing conditions: current traffic control and geometric conditions (AM Peak)
- Existing conditions: current traffic control and geometric conditions (PM Peak)
- Optimized control: optimized timing plans with current control and geometry (AM Peak)
- Optimized control: optimized timing plans with current control and geometry (PM Peak)
- Signal at Trenton Dr. (AM Peak)
- Signal at Trenton Dr. (PM Peak)

### **15-Year Forecast (2024)**

- Existing traffic control and geometric conditions (AM Peak)
- Existing traffic control and geometric conditions (PM Peak)
- Signal at Trenton Dr. (AM Peak)
- Signal at Trenton Dr. (PM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (AM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (PM Peak)

### **26-Year Forecast (2035 TDM Forecast)**

- Existing traffic control and geometric conditions (AM Peak)
- Existing traffic control and geometric conditions (PM Peak)
- Signal at Trenton Dr. (AM Peak)
- Signal at Trenton Dr. (PM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (AM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (PM Peak)
- Signal at Trenton Dr. and NE/SW Loop Ramp (AM Peak)
- Signal at Trenton Dr. and NE/SW Loop Ramp (PM Peak)

### **50-Year Forecast (2059)**

- Existing traffic control and geometric conditions (AM Peak)
- Existing traffic control and geometric conditions (PM Peak)
- Signal at Trenton Dr. (AM Peak)
- Signal at Trenton Dr. (PM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (AM Peak)
- Signal at Trenton Dr. and NE Loop Ramp (PM Peak)
- Signal at Trenton Dr. and NE/SW Loop Ramp (AM Peak)
- Signal at Trenton Dr. and NE/SW Loop Ramp (PM Peak)
- Signal at Trenton Dr. and NE Loop Ramp with a 6-Lane Corridor (AM Peak)
- Signal at Trenton Dr. and NE Loop Ramp with a 6-Lane Corridor (PM Peak)

Note: The two 6-lane scenarios were performed due to congestion that developed with the 4-lane corridor.

## **5.0 TRAFFIC VOLUME DATA**

Traffic counts were obtained from the City of Bismarck for the intersections of Century Ave. & Centennial Rd, Trenton Dr. & Centennial Rd, Bismarck Expy & I-94 North Ramp, Bismarck Expy & I-94 South Ramp, and Bismarck Expy & Divide Ave. The AM and PM peak-hour volumes were obtained from the count data and were used as a basis of comparison for the other scenarios. The AM peak-hour occurred from 7:15 a.m. to 8:15 a.m., while the PM peak-hour occurred from 4:45 p.m. to 5:45 p.m.

The traffic volume projections for the future planning horizons were calculated using the Bismarck-Mandan MPO's TDM. The long-range scenario of the TDM represents the 2035 planning horizon. These scenarios include the transportation network and socio-economic projects (household and employment data), which were provided by the MPO. The ADT data from the 2035 model will be compared to those from the 2007 scenario, which is the calibrated base year of the planning model, to determine an annual growth factor (note Appendix A for ADT information). The corresponding growth factor on each link in the network will be used to determine the volume increase over the existing peak-hour traffic (Figures 2-3). The resulting growth factors will be applied to the links of the 2024 and 2035 scenarios.

Figure 2. AM Peak Hour Volumes and Growth Factors

Figure 3. PM Peak Hour Volumes and Growth Factors

To obtain 2059 traffic volume estimates, the full build-out information for the planning level analysis area will be provided by the Bismarck-Mandan MPO and incorporated into the TDM. Note that the full build-out information does not represent a specific planning horizon and may not ever be realized; however, it will allow us to estimate the current level of development and will be used to determine potential future levels of development.

The household and employment growth rates of the study area's traffic analysis zones (TAZ) between the 2007 and 2035 planning horizons will be used to estimate the 2059 development. The 2007 planning horizon represents 14% and 4% of the study area's full build-out households and jobs, respectively (Table 1). Based on the 2035 socio-economic projections, these percentages increase to 37% (households) and 23% (jobs) of the full build-out scenario. This level of growth (simple interest) averages 0.8% per year for households and 0.7% for jobs between 2007 and 2035 (shown in Appendix B). To maintain a similar growth trend, the 2059 scenario will include an additional 25% of the available households and jobs to the 2035 data, which are not fully developed by 2035. This process provides an average annual growth of 0.8% (households) and 1.0% (jobs) between 2035 and 2059. Therefore, the 2059 scenario would represent 57% (households) and 47% (jobs) of the study area's full build-out scenario.

Table 1. Full Build-out and Growth Rates for 2007, 2035, and 2059 Planning Horizons.

| Planning Horizon | Households<br>(% of Full Build-out) | Total Jobs<br>(% of Full Build-out) | Household<br>(Avg. growth/yr.) | Total Jobs<br>(Avg. growth/yr.) |
|------------------|-------------------------------------|-------------------------------------|--------------------------------|---------------------------------|
| 2007             | 14%                                 | 4%                                  | -                              | -                               |
| 2035             | 37%                                 | 23%                                 | 0.8%                           | 0.7%                            |
| 2059             | 57%                                 | 47%                                 | 0.8%                           | 1.0%                            |

## 6.0 OPERATIONAL ANALYSIS

A Synchro network will be created for each of the 30 scenarios, which includes the corresponding traffic volumes and geometric attributes. The optimized timing plans incorporated a 100-second cycle length and the phase split and offset optimization will focus on reducing intersection and network delay. Roadway reconstruction is scheduled in 2010 for Centennial Rd, which will widen the roadway from Trenton Dr. north to Saratoga Rd. These changes will be reflected in the 2024 Synchro networks to provide an accurate basis of comparison.

To provide a realistic representation of future changes to the network, the 2035 and 2059 scenarios will incorporate a significant amount of geometric enhancements to account for the increased traffic volumes. The primary modifications will include changing Century Ave. to a four-lane facility, and adding turning lanes at intersections where turning volumes are significant. In addition, left-turn lanes will be added when the corresponding volumes exceeded 100 vehicles/hour and dual left-turn lanes will be added when volumes exceeded 300 vehicles/hour (e.g., westbound left-turn movement at Century Ave. and eastbound left-turn movement at the I-94 South Ramp). Note that the side-street geometry of the Divide Ave. and Bismarck Expy Intersection will remain unchanged for this analysis.

## 7.0 ANALYSIS RESULTS

The Centennial Rd/Bismarck Expy (Exit 161) corridor at I-94 was analyzed to evaluate improvements to the intersections adjacent to the interchange, and to evaluate potential impacts on the interchange ramps/intersections. A total of five intersections were analyzed for each of the scenarios, with proposed changes ranging from optimizing existing signal timings to extensive geometric enhancements (note Appendix C for details). Note that, although modifications (such as a signal) may be proposed at an intersection, this study took a systems

approach for evaluating the operations of the facility rather than a detailed study of each individual intersection. Before a signal is installed at an intersection, signal warrants must be met based on the current conditions, or those of the near future. This section will discuss each of the scenarios, and will provide some insight as to how proposed changes impact the corridor.

Based on discussion with the steering committee, a future interchange at 66<sup>th</sup> St. E. on Centennial Rd/Bismarck Expy would be implemented by 2035. To illustrate the traffic impacts on Centennial Rd/Bismarck Expy, the 2035 TDM was run with and without the 66<sup>th</sup> St. Interchange. When the 66<sup>th</sup> St. Interchange is not included into the network, traffic volume along Centennial Rd/Bismarck Expy increases, particularly for the westbound movement at the north ramp and the eastbound movement at the south ramp, which are 56% and 14% higher, respectively for the 2035 planning horizon (Table 2). Since the 66<sup>th</sup> St. Interchange will be 2 miles east of Centennial Rd/Bismarck Expy, the corridor will not experience a significant change in traffic volume with the additional interchange.

Table 2. 2035 Network Volume Comparison (vehicles per day)

| Approach                                   | 2035 with 66 <sup>th</sup> St. E. Interchange | 2035 without 66 <sup>th</sup> St. E. Interchange |
|--------------------------------------------|-----------------------------------------------|--------------------------------------------------|
| <b>Bismarck Expy &amp; I-94 North Ramp</b> |                                               |                                                  |
| Westbound                                  | 2,354                                         | 3,674                                            |
| Southbound                                 | 13,680                                        | 13,902                                           |
| Northbound                                 | 16,914                                        | 17,574                                           |
| <b>Bismarck Expy &amp; I-94 South Ramp</b> |                                               |                                                  |
| Eastbound                                  | 7,736                                         | 8,824                                            |
| Southbound                                 | 13,620                                        | 14,346                                           |
| Northbound                                 | 18,279                                        | 19,191                                           |

Under the existing two-way stop control at Trenton Dr., a significant amount of delay was incurred by the vehicles attempting to turn onto Centennial Rd/Bismarck Expy, which contributes to the network delay. Due to the significant volume on Centennial Rd, the capacity calculation for the side-streets is shown to be zero in Synchro and the Highway Capacity Manual (HCM). Therefore, Synchro's methodology for calculating the delay with this condition is to assign the movement a delay of 9,999 seconds per vehicle. So, the delay of 9,999 seconds is multiplied by the number of vehicles at that approach. Although the approximated value for delay is exaggerated, a high value is used because the delay cannot be defined. The network delay reflects this calculation, which is why there is such a large discrepancy between the unsignalized and signalized scenarios. Based on the provided turning movement counts, some capacity exists for Trenton Dr. during the peak periods. Reasons for this may include more north/south gaps existing in the field, side-street traffic accepts significantly smaller gaps, etc. The addition of a signal will likely increase the network delay due to impacting vehicles on the major street. However, the current values reflect the severity of the current situation at the intersection of Trenton Dr & Centennial Rd. The overestimated network delay values are noted in Tables 3-6.

## 7.1 Base Year (2009)

Existing conditions along the Exit 161 corridor are considerably worse for the AM peak, which has a network delay of 1,104 hours compared with 511 hours of delay for the PM peak (Table 3). Optimizing the signals along the corridor yields a slight reduction in network delay for the AM peak and a slight increase in network delay for the PM peak.

The intersection of Century Ave. and Centennial Rd is experiencing a LOS of “F” during the AM Peak (Table 3). The two critical movements at this intersection are the southbound through movement and the westbound left-turn movement. The existing westbound left-turn volume at this intersection is approximately 500 vehicles during the AM peak. In addition, both Century Ave. and Centennial Rd are 2-lane facilities, which limit the capacity of the intersection. The PM peak period at this intersection is currently operating with a LOS of “C,” with the critical movements being the northbound and southbound through movements.

The intersection of Trenton Dr. and Centennial Rd currently operates as a two-way stop, which has vehicles on Trenton Dr. yielding to those on Centennial Rd. The two-way stop control creates significant delay and the operational analysis returns an error due to the calculated value exceeding the limitations of Synchro (Table 3). Note that incorporating signalized control at this intersection greatly reduces the overall network delay. Although a signal improves the intersection operations, the LOS was reported to be an “F,” so further geometric enhancements will be needed. In addition, the calculated queue lengths for a signalized intersection should not have negative effects on the I-94 North Ramp due to potential spillback (as long as reasonable signal timing values are used).

The I-94 North Ramp currently experiences a LOS of “F” during the AM peak and a “B” during the PM peak (Table 3). The critical movements for this intersection are the northbound left-turn and the southbound through during the AM peak, and the northbound through and northbound left during the PM peak. Optimizing the current network improves the LOS from a “F” to a “D,” as does the addition of a signal at Trenton Dr. The operations during the PM peak showed an improvement from a LOS “B” to an “A” with the optimization and addition of a signal at Trenton Dr.

The I-94 South Ramp currently has a LOS of “C” during the AM peak and a LOS of “B” during the PM peak (Table 3). Optimizing the current timings improves the AM peak LOS to a “B.” However, no significant changes were observed at this intersection when a signal was implemented at Trenton Dr.

The intersection of Divide Ave. and Bismarck Expy is operating with a LOS of “B” for both the AM and PM peak hours. It should be noted that neither optimizing the current timings nor the addition of a signal at Trenton Dr. and Centennial Rd had any significant impact on this intersection, which continued to operate at a LOS of “B” (Table 3). The complete intersection inputs and outputs for the 2009 scenarios are provided in Appendices D – I.

Table 3. 2009 Synchro Output

| Scenario                                                      | AM Peak           |                           |          | PM Peak           |                         |          |
|---------------------------------------------------------------|-------------------|---------------------------|----------|-------------------|-------------------------|----------|
|                                                               | Network Delay (h) | Queue Length (ft)         | Int. LOS | Network Delay (h) | Queue Length (ft)       | Int. LOS |

\* - Error in calculation (value is not obtainable), queue length represents Synchro's 95% queue.

\*\* - Overestimated delay due to Synchro's calculation of side-street delay on Trenton Dr.

Note: The signal timing was optimized for each scenario except for the Existing Conditions.

## 7.2 15-Year Forecast (2024)

At the intersection of Century Ave. and Centennial Rd, the 2024 scenarios provided outputs of a LOS of "F" for all of the AM peaks (Table 4). The PM peak LOS was slightly better, having a LOS of "C" for the Existing Control scenario. The PM LOS remained at a "C" for the scenarios implementing a signal at Trenton Dr. and the addition of a NE loop ramp.

When the 2024 network was analyzed using the existing control at the intersection of Trenton Dr. and Centennial Rd, the resulting output indicated an error due to the excessive side-street delay and queue lengths (Table 4). This trend continued for every scenario utilizing the existing

(two-way stop) control. When signalized control was implemented at this intersection, the analysis reported a LOS of “B” for both the AM and PM peak-hour periods. The critical movement during the AM peak was the eastbound right-turn, while the critical movements for the PM peak were the northbound and westbound through movements.

Using the existing intersection control at the intersection of Bismarck Expy and the I-94 North Ramp, a LOS of “D” (AM peak) and “A” (PM peak) were realized (Table 4). The addition of a traffic signal at Trenton Dr. and Centennial Rd had a slight impact on the operations of the north ramp. The LOS changed to an “E” for the AM and a “B” for the PM peak hours. The addition of a NE loop ramp at this intersection significantly improved the LOS during both the AM and PM peaks, which was reported as an “A” for both.

The analysis results for the I-94 South Ramp remained largely unchanged for each of the three scenarios in the 2024 network (Table 4). The intersection LOS output was a “B” during all of the PM peak hours. The AM peak hour results also reported a LOS of “B” for the existing control, and for the Trenton Dr. signalized scenario. The LOS decreased from a “B” to a “C” when the NE loop on-ramp is implemented, which can be expected due to the large platoon of southbound vehicles travelling through the I-94 North Ramp intersection from Trenton Dr.

The intersection of Divide Ave. and Bismarck Expy did not show a significant change in LOS for any of the scenarios. The AM peak LOS remained at “B” and the PM peak LOS was “C” for each scenario (Table 4). The complete intersection inputs and outputs for the 2024 scenarios are provided in Appendices J – O.

Table 4. 2024 Synchro Output

| Scenario                                                          | AM Peak           |                        |          | PM Peak           |                      |          |

\* - Error in calculation (value is not obtainable), queue length represents Synchro's 95% queue.

\*\* - Overestimated delay due to Synchro's calculation of side-street delay on Trenton Dr.

Note: The signal timing was optimized for each scenario.

### 7.3 26-Year Forecast (2035)

The intersection of Century Ave. and Centennial Rd experienced a significant amount of vehicles travelling south and west during the AM peak. As a result, the LOS remains a "F" for all four of the analysis scenarios (Table 5). However, the PM peak LOS was reported as a "C" for the existing conditions, which improves to a "B" for the three alternative scenarios.

The analysis of the Trenton Dr./Centennial Rd intersection again provided invalid results for the existing two-way stop control in the 2035 network (Table 5). However, the addition of a traffic signal provided a LOS of “C” during the AM peak and a LOS of “D” during the PM peak. The AM peak LOS improves to a “B” with the addition of the NE and NE/SW loop ramps. It should be noted that the reported 95<sup>th</sup> percentile queue lengths are approximately 1,029 ft, which may have an effect on I-94 North Ramp (the approximate distance between the North Ramp and the Trenton Dr./Centennial Rd intersection is 780 ft).

The I-94 North Ramp experienced a LOS of “E” for the existing control scenario during the AM peak and a LOS of “B” during the PM peak (Table 5). It should be noted that due to the volume of traffic on Centennial Rd, the NB queue may potentially encroach into the intersection of the North Ramp. Although the LOS remains the same when a signal is added at Trenton Dr., the NB queue lengths at Trenton Dr. may potentially encroach into the intersection of the North Ramp. In addition, the scenarios having the NE loop ramp and the NE/SW loop ramp provide an improved LOS of “A” for both the AM and PM peak hours. However, the NB queues from Trenton Dr. will still potentially exceed the distance between the two intersections.

The I-94 South Ramp (Existing Control) produced a LOS “B” during the AM peak, which remained unchanged when a traffic signal was implemented at Trenton Dr. (Table 5). The LOS for both ramp scenarios during the AM peak was a “B.” During the PM peak, all of the scenarios provided a LOS of “B” for the south ramp intersection.

The intersection of Divide Ave. and Bismarck Expy experienced a LOS of “B” for all of the AM peak scenarios (Table 5). In addition, all of the PM peak scenarios reported a LOS of “C.” The complete intersection inputs and outputs for the 2035 scenarios are provided in Appendices P – W.

Table 5. 2035 Synchro Output

| Scenario                                                          | AM Peak           |                   |          | PM Peak           |                   |          |
|-------------------------------------------------------------------|-------------------|-------------------|----------|-------------------|-------------------|----------|

\* - Error in calculation (value is not obtainable), queue length represents Synchro's 95% queue.

\*\* - Overestimated delay due to Synchro's calculation of side-street delay on Trenton Dr.

Note: The signal timing was optimized for each scenario.

## 7.4 50-Year Forecast (2059)

The 50-year forecast network geometry remained the same as the 2035 network to show the impact of traffic growth due to the modified and additional development over an additional 15-year period. Using the existing intersection control, the network delay was 2,179 hours (AM peak) and 1,416 hours (PM peak), as shown in Table 6.

The scenario implementing the signal at Trenton Dr. and the NE loop ramp provided a network delay for the AM Peak (336 hours) and PM Peak (210 hours). Adding a signal at Trenton Dr. and both the NE and SW loop ramps had no significant effect on network delay for the AM peak hour (336 hours) and PM peak hour (209 hours).

At the intersection of Century Ave. and Centennial Rd, all scenarios returned a LOS of “F” for the AM peak and a “C” during the PM peak (Table 6). The critical movements at this intersection were the southbound through and westbound left-turn which occurred during the AM peak. The results from the analysis at Trenton Dr. and Centennial Rd also remained relatively constant, having a LOS of “E” during the PM peak. The AM peak LOS improved from a “C” for the Trenton Dr. signal scenario to a “B” for the two remaining scenarios. Note that due to the traffic volumes on Centennial Rd. and the relatively limited capacity of the roadway facility, the northbound 95% queue lengths exceed the distance to the North Ramp of I-94 by approximately 400 ft. This potential spillback may affect the operations at the intersection of the North Ramp.

The I-94 North Ramp experienced a LOS of “F” during the AM peak and a “B” during the PM peak (Table 6). The signal at Trenton Dr. may have an effect on the north ramp during the PM peak due to capacity issues on Centennial Rd/Bismarck Expy. The two scenarios utilizing loop ramps at the I-94 interchange showed a significant improvement in LOS, which changed to an “A” for both the AM and PM peak hours.

The I-94 South Ramp experienced a LOS of a “C” during both the AM and PM peak periods when the existing control was used (Table 6). The addition of a signal at Trenton Dr. did not change the operations at the south ramp. The LOS for the AM and PM peak periods remained a “C” for the remaining scenarios.

Although several geometric changes were incorporated into analysis, no modifications were made to the Divide Ave. approaches at the intersection of Bismarck Expy and Divide Ave. (Table 6). As a result the intersection delay calculated for the 2059 horizon was excessive. The LOS during the AM peak remained a “D” for all scenarios, and an “E” for all PM peak hour scenarios. The complete intersection inputs and outputs for the 2059 scenarios are provided in Appendices X – EE.

Table 6. 2059 Network Output

| Scenario                                                          | AM Peak           |                   |          | PM Peak           |                   |          |
|-------------------------------------------------------------------|-------------------|-------------------|----------|-------------------|-------------------|----------|
|                                                                   | Network Delay (h) | Queue Length (ft) | Int. LOS | Network Delay (h) | Queue Length (ft) | Int. LOS |

\* - Error in calculation (value is not obtainable), queue length represents Synchro's 95% queue.

\*\* - Overestimated delay due to Synchro's calculation of side-street delay on Trenton Dr.

Note: The signal timing was optimized for each scenario.

Due to the degradation of the LOS at several intersections during the 2059 output, the corridor was also analyzed as a 6-lane arterial. The 6-lane facility was created several hundred feet prior to Century Ave. and Divide Ave to provide adequate transitions between the 4 and 6-lane facilities. Based on the projected 2059 ADT and LOS thresholds, extending the 6-lanes to Main Ave. would provide additional benefits. Table 7 illustrates the comparison between a 4-lane and 6-lane corridor for the Trenton Dr. signal & NE Loop Ramp scenario, which provided the most long-term benefits. Improvements can be seen in the AM and PM network delays, as well as a majority of the intersection LOS. Detailed comparisons for the I-94 North and South Ramps are discussed in the previous sections. Typical ADT thresholds for a 4-lane facility with left- and right-turn lanes operating at a LOS “D” range from 30,000 to 35,000 vehicles. The projected 2059 ADT for Centennial Rd/Bismarck Expy ranges from 25,800 (just south of Century Ave.) to 42,500 (between Divide Ave. and the I-94 South Ramp), as shown in Appendix A. The complete intersection inputs and outputs for the 6-lane scenarios are provided in Appendices FF – GG.

Table 7. 2059 Synchro Output Comparison (4-Lane &amp; 6-Lane)

| Scenario                                                          | AM Peak           |                   |          | PM Peak           |                   |          |

## 7.5 I-94 Interchange Ramp Operations

This section illustrates the detailed output for the intersections at the north and south ramps of the I-94 and Centennial Rd/Bismarck Expy Interchange. One of the main objectives of this study was to determine if and when loop ramps will be needed at these intersections to facilitate traffic accessing I-94.

### 7.5.1 I-94 North Ramp

During the AM peak-hour period, the I-94 North Ramp illustrated LOS ranging from “D” to “F” during the 2009 base case (Table 8). The existing optimized and Trenton Dr. signal scenarios provide a LOS of “D.” It should be pointed out that some of the intersection improvements are a

result of increasing the green time for the southbound phase, which increases the delay for the northbound left-turn phase. For the 2035 and 2059 planning horizons, the scenarios incorporating NE and NE/SW loop ramps provide LOS of “A.”

The northbound left-turn movement had AM peak traffic volume for the 2009, 2024, 2035, and 2059 planning horizons of 331, 412, 471, and 447 vehicles, respectively. Due to the large number of traffic traveling southbound, the northbound left-turn movement is only able to turn during the protected portion of the northbound protected/permitted phase. For the 2009 horizon, the LOS for the northbound left-turn movement ranges from a “C” to an “F” and the addition of the Trenton Dr. signal does not significantly affect the north ramp’s operation compared to the Existing Optimized scenario (Table 8). The LOS for the northbound left-turn phase remains an “F” unless a NE loop ramp is incorporated, which eliminates delay for this movement and improves the southbound delay since the left-turn phase is removed. Therefore, the intersection delay is significantly reduced with the NE loop ramp, which would be realized at the present time.

During the PM peak-hour period, the I-94 North Ramp exhibited LOS ranging from “A” to “B” for the 2009 base case (Table 9). A signal installation at Trenton Dr. improved the intersection to a LOS of “A.” The 2024, 2035, and 2059 planning horizons incorporating NE and NE/SW loop ramps provide intersection LOS of “A.”

The northbound left-turn movement had PM peak traffic volume for the 2009, 2024, 2035, and 2059 planning horizons of 371, 462, 528, and 501 vehicles, respectively (Table 9). Because the southbound movement has significantly less traffic during the PM peak compared to the AM peak, the northbound left-turn movement does not experience significant delay time. The signal installation at Trenton Dr. creates additional gaps for the northbound left-turn movement, resulting in lower delay time. As expected, incorporating NE and NE/SW loop ramps eliminates delay time for this movement.

Table 8. I-94 North Ramp (AM Peak)

|                  | Scenario                              | MOE       | WB Approach |      | NB Approach |     |     | SB Approach |       | Int. Summary |
|------------------|---------------------------------------|-----------|-------------|------|-------------|-----|-----|-------------|-------|--------------|
|                  |                                       |           | L           | R    | L           | T   | R   | T           | R     |              |

### 7.5.2 I-94 South Ramp

During the AM peak-hour period, the I-94 South Ramp illustrated LOS ranging from “B” to “C” during the 2009 base case (Table 10). The signal installation at Trenton Dr. provides a LOS of “B” for the 2009 planning horizon, which is the same as the existing conditions. The

southbound left-turn movement has a low number of vehicles (23 to 39 vehicles), resulting in lower delay time for all planning horizons and scenarios.

The critical movement for the I-94 South Ramp during the AM peak period is the eastbound right-turn movement (Table 10). To bring the LOS to at least a "D" for all planning horizons, two right-turn lanes were incorporated into the 2035 and 2059 planning horizons to serve the forecasted traffic (720 vehicles in 2035 and 764 vehicles in 2059).

During the PM peak-hour period, the I-94 South Ramp illustrated LOS ranging from "B" to "C" among all analysis scenarios (Table 10). For the 2009 base case, the signal installation at Trenton Dr. provides a LOS of "B," which is the same as the existing conditions. The southbound left-turn movement has a low number of vehicles (27 to 46 vehicles); however, the opposing northbound through traffic ranges from 1,134 to 1,862. Therefore, delay time increases for each planning horizon. Note that the delay for the southbound left-turn phase could be decreased with the addition of a left-turn phase (when the turning traffic exceeds 100 vehicles per hour).

Similar to the AM peak, the critical movement for PM peak at the I-94 South Ramp was the eastbound movement (Table 11). The eastbound left-turn movement incurred the highest delay during the PM Peak. Incorporating two left-turns achieved a LOS of "D" for all planning horizons to serve the forecasted traffic (529 vehicles for 2035 and 561 vehicles for 2059).

Table 10. I-94 South Ramp (AM Peak)

## 8.0 SUMMARY/RECOMMENDATIONS

The purpose of this study was to evaluate the operational performance of Centennial Rd/Bismarck Expy and I-94 Interchange and surrounding intersections between Divide Ave. and Century Ave. This study evaluated a total of 30 different scenarios using various intersection controls and geometric alternatives.

Currently, the corridor experiences significant traffic volume and congestion during the AM and PM peak-hour periods. The congestion along this corridor will continue to increase as development continues on the east side of Bismarck, ND. Although an additional interchange at 66<sup>th</sup> St. E. will assist the eastern portion of the city, traffic forecasts estimate that this interchange will not significantly relieve traffic volume along the Centennial Rd/Bismarck Expy corridor.

To assist the traffic operations in the near- and long- term planning horizons, several traffic control and geometric improvements could be incorporated. Although a signal warrant was not conducted at Trenton Dr. (as a part of this study), it was observed that the installation of a traffic signal at this intersection would benefit the traffic operations for the existing and future conditions, although there is a potential for spillback into the I-94 North Ramp in the 2035 and 2059 4-lane network scenarios. Signalizing this intersection was also recommended by a previous traffic study that was conducted by Kadrmas, Lee, and Jackson, Inc. [1].

A comparison was conducted for the 2059 network which modeled Centennial Rd/Bismarck Expy as both a 4-lane and a 6-lane corridor. The results of the comparison showed several benefits to expanding the corridor to six lanes, such as reducing overall network delay and improving several intersection LOS. In addition, the ADT along Centennial Rd/Bismarck Expy ranges from 25,800 to 42,500 vehicles. The threshold ADT for a 4-lane arterial with turning lanes to maintain a LOS "D" can range from 30,000 to 35,000 vehicles. Another benefit of increasing the corridor to 6-lanes is the potential for eliminating any spillback of vehicles into adjacent intersections.

Although geometric changes (the addition of turn lanes) were made to Century Ave. for the 2035 and 2059 scenarios, the LOS remained at an "F." The LOS at this intersection was also reported as an "F" for the 6-lane 2059 network. Since Century Ave. is the only route for drivers to the northwest of the study area, the geometric changes do little to alleviate the delays at the intersection of Centennial Rd and Century Ave. The delays experienced at this intersection may force drivers to alter their routes or departure times.

The long-term improvements relate to geometric modifications of the corridor. Based on the planning and operational analyses conducting in this study, several geometric improvements could be incorporated to accommodate the current and future traffic volume. The main improvements relate to incorporating a NE loop ramp, and expanding Centennial Rd/Bismarck Expy to a six-lane roadway by 2059. Due to the low southbound left-turn traffic (current and projected) at the I-94 South Ramp, a SW loop ramp is not recommended at this time. However, a southbound left-turn phase may be incorporated if traffic volume increases. The modifications that will enhance the study area along with the planning horizon that receives significant benefits include the following:

- Widen Century Ave. to a four-lane cross section with turn lanes (2009)
- Add a dual westbound left-turn at Century Ave. (2009)
- Install a traffic signal at the intersection of Trenton Dr. & Centennial Rd with turn lanes (2009)
- Add a NE loop ramp at the I-94 North Ramp (2009)

- Widen the eastbound off-ramp of the I-94 South Ramp to accommodate dual left-turn and dual right-turn lanes (2035)
- Widen the Centennial Rd/Bismarck Expy to a six-lane cross section with left and right turn lanes (2059)

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 1 (1%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.70

Intersection Signal Delay: 15.1

Intersection LOS: B

Intersection Capacity Utilization 65.8%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 1: Divide Ave & N Bismarck Expy

## Bismarck Exit 161 Operational Study

## 2: South Ramp &amp; Centennial Rd

**Intersection Summary**

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 2 (2%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.96

Intersection Signal Delay: 21.6

Intersection LOS: C

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp &amp; Centennial Rd

**Intersection Summary**

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 9 (10%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 150

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.44

Intersection Signal Delay: 157.4

Intersection LOS: F

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: North Ramp &amp; Centennial Rd

**Intersection Summary**

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.81

Intersection Signal Delay: 174.2

Intersection LOS: F

Intersection Capacity Utilization 117.2%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 5: Century Ave &amp; Centennial Rd

## **Appendix E: 2009 - Existing Conditions PM (1A2)**

## Bismarck Exit 161 Operational Study

## 1: Divide Ave &amp; N Bismarck Expy

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 1 (1%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.85

Intersection Signal Delay: 19.3

Intersection LOS: B

Intersection Capacity Utilization 66.3%

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Divide Ave & N Bismarck Expy

## Bismarck Exit 161 Operational Study

**Intersection Summary**

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 9 (10%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 11.3

Intersection LOS: B

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp &amp; N Bismarck Expy

### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 2 (2%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.66

Intersection Signal Delay: 15.0

Intersection LOS: B

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 3: North Ramp & Centennial Rd

**Intersection Summary**

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 0 (0%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.99

Intersection Signal Delay: 33.4

Intersection LOS: C

Intersection Capacity Utilization 87.3%

ICU Level of Service E

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 5: Century Ave &amp; Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 6 (7%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.70

Intersection Signal Delay: 12.4

Intersection LOS: B

Intersection Capacity Utilization 65.8%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 1: Divide Ave & Bismarck Expy

Exit 161 Operational Study  
Bismarck, ND

2: South Ramp & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 88 (98%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.87

Intersection Signal Delay: 14.7

Intersection LOS: B

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 64 (71%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.24

Intersection Signal Delay: 49.3

Intersection LOS: D

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: North Ramp & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 35 (39%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.81

Intersection Signal Delay: 173.6

Intersection LOS: F

Intersection Capacity Utilization 117.2%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 5: Century Ave & Centennial Rd

## **Appendix G: 2009 – Existing Conditions Optimized PM (1A2.5)**

Exit 161 Operational Study  
Bismarck, ND

1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 26 (29%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.84

Intersection Signal Delay: 19.0

Intersection LOS: B

Intersection Capacity Utilization 66.3%

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 15 (17%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 11.0

Intersection LOS: B

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 16 (18%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 9.4

Intersection LOS: A

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 3: North Ramp & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 77 (86%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.81

Intersection Signal Delay: 24.0

Intersection LOS: C

Intersection Capacity Utilization 87.3%

ICU Level of Service E

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 5: Century Ave & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 10 (11%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.70

Intersection Signal Delay: 13.0

Intersection LOS: B

Intersection Capacity Utilization 65.8%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 18 (20%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.87

Intersection Signal Delay: 15.9

Intersection LOS: B

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 80 (89%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.24

Intersection Signal Delay: 44.4

Intersection LOS: D

Intersection Capacity Utilization 82.9%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: North Ramp & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 60 (67%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 150

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.63

Intersection Signal Delay: 192.2

Intersection LOS: F

Intersection Capacity Utilization 111.9%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 4: Trenton Dr & Centennial Rd

|                                                                                        |                                                                                         |                                                                                          |

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 89 (99%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.81

Intersection Signal Delay: 173.9

Intersection LOS: F

Intersection Capacity Utilization 117.2%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 5: Century Ave & Centennial Rd

**Appendix I: 2009 - Signal at Trenton PM (1B2)**

Exit 161 Operational Study  
Bismarck, ND

1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 33 (37%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.84

Intersection Signal Delay: 19.6

Intersection LOS: B

Intersection Capacity Utilization 66.3%

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 37 (41%), Referenced to phase 2:SBTL and 6:NBT, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 10.9

Intersection LOS: B

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: South Ramp & Bismarck Expy

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 34 (38%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 9.2

Intersection LOS: A

Intersection Capacity Utilization 61.4%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: North Ramp & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 60 (67%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.29

Intersection Signal Delay: 52.2

Intersection LOS: D

Intersection Capacity Utilization 100.2%

ICU Level of Service G

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 4: Trenton Dr & Centennial Rd

#### Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 73 (81%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.81

Intersection Signal Delay: 18.6

Intersection LOS: B

Intersection Capacity Utilization 87.3%

ICU Level of Service E

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 5: Century Ave & Centennial Rd

## **Appendix J: 2024 - Existing Control AM (2A1)**

Exit 161 Operational Study  
Bismarck, ND

1: Divide Ave & Bismarck Expy

#### Intersection Summary

Area Type: Other

Cycle Length: 100

Actuated Cycle Length: 100

Offset: 95 (95%), Referenced to phase 2:SBTL and 6:NBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.70

Intersection Signal Delay: 12.8

Intersection LOS: B

Intersection Capacity Utilization 81.6%

ICU Level of Service D

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Divide Ave & Bismarck Expy
